PROFESSIONAL SUMMARY

Full-stack software engineer building production software across customer-facing attractions, cloud services, and hardware-integrated systems. Experienced with React, TypeScript, Node.js, SQL, Electron, AWS, and AI-assisted development using GitHub Copilot and OpenAI Codex. Own features from architecture and implementation through testing, weekly deployment, and production support. Currently building familiarity with Ruby on Rails.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL, C, PHP, Go, Java

Frameworks / Platforms: React, Node.js, Electron, Ruby on Rails (introductory exposure), Flask, Socket.IO, NASA cFS

Data / Cloud / Infrastructure: PostgreSQL, MySQL, MongoDB, AWS (S3, SES; RDS/Aurora exposure), DigitalOcean, Docker, Linux, Nginx, Apache, SFTP/SSH

Testing / Tools / Concepts: Node.js built-in test runner (node:test), GitHub Copilot, OpenAI Codex, Git, Jira, REST APIs, WebSockets, Authentication, Distributed Systems, Asynchronous Systems, Caching, Production Debugging

EXPERIENCE

Software Engineer

September 2024 – Present

LT Equipment (Lasertron)

Buffalo, NY

- Own full-stack development, weekly releases, and production support across four React, TypeScript, Node.js, Electron, PHP, and SQL codebases powering social-gaming attractions for 350+ client companies; deploy to Linux systems, maintain AWS S3 and SES workflows, and preserve rollback-ready versions.
- Re-architected animation rendering across three products by replacing decompressed GIF-frame preloading with a reusable PNG spritesheet API, reducing startup time from as long as 10 minutes to near-instant and eliminating browser storage crashes.
- Built personalized customer scorecards and statistics workflows integrating attraction software with a legacy PHP POS REST API, SQL storage, account registration and updates, and cloud-hosted customer pages with interactive usage data.
- Designed cross-device messaging, sequencing, and handshake logic for projectors, touchscreens, and central controllers, reducing silent race-condition failures and adding actionable logging for asynchronous production issues.
- Implemented multilingual architecture across attraction products, enabling international deployments and supporting sales to new markets, including clients in Saudi Arabia.
- Use GitHub Copilot and OpenAI Codex for refactoring, asynchronous-system debugging, Node.js test generation, and test-case discovery; validate changes through architecture summaries, file-by-file diff review, automated tests, and hardware-in-the-loop testing.
- Guide a junior developer through implementation planning, code review, merge-conflict resolution, debugging, and architecture decisions while translating technical tradeoffs for executives, product managers, sales teams, and client-facing staff.

Software & Systems Engineer

June 2022 – May 2024

University at Buffalo Nano-Satellite Laboratory

Buffalo, NY

- Built and tested Guidance, Navigation, and Control software in C, Python, and NASA cFS for a student-led satellite program funded by the U.S. Army.
- Integrated gyroscope data and developed magnetometer and GPS tooling supporting satellite orientation, navigation, and simulated flight testing.
- Led weekly coordination for a 16-member engineering team and translated subsystem requirements into software tasks, technical reviews, and integration work.
- Automated extraction of 40,000+ function parameters, reducing manual lookup work and supporting memory optimization on Intel Edison flight hardware.

PROJECTS

Personal Portfolio Website | *React, TypeScript, Vite, Tailwind CSS, Vercel*

rayrod.dev

- Designed and deployed a responsive portfolio with reusable React components, custom SVG illustrations, animated interfaces, and tailored mobile and desktop experiences; configured production hosting and a custom domain through Vercel.

EDUCATION

University at Buffalo, State University of New York

Buffalo, NY

Bachelor of Science in Computer Science

June 2024
