PROFESSIONAL SUMMARY

Full-stack software engineer building production software across customer-facing attractions, point-of-sale systems, internal tooling, and aerospace systems. Strong in TypeScript, Node.js, Python, SQL, and C; comfortable working with product leaders, client-facing teams, and non-technical stakeholders to turn ambiguous operational problems into software that gets used.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL, C, PHP, Java, Go

Frameworks / Platforms: Node.js, React, Electron, Flask, Socket.IO, REST APIs, AWS (S3, ECS), DigitalOcean, NASA cFS

Data / Databases: MySQL, PostgreSQL, MongoDB, Pandas, NumPy, scikit-learn

Tools / Coursework: Git, Jira, Linux, Docker, Distributed Systems, Machine Learning, Computer Security, Systems Design, Statistics

EXPERIENCE

Software Engineer

September 2024 – Present

Lasertron

Buffalo, NY

- Own full-stack development and production support as the primary developer for Electron-based attraction applications and a customer-location point-of-sale system, using Node.js, TypeScript, AWS, and SQL-backed services across 4 production codebases.
- Contributed to company annual revenue growth from roughly \$15–20M to approximately \$30M by rapidly shipping client-requested features that helped sales close deals and expand deployments.
- Work directly with executives, product managers, sales, client-facing teams, and location staff to turn field feedback into production features used by customer locations.
- Maintain point-of-sale and location-management workflows sold alongside the attractions, including customer configuration, reporting, location setup, and day-to-day staff operations.
- Reduced customer and operator onboarding time by roughly 40% by improving setup flows, in-app guidance, and training paths for location staff learning to use the software.
- Investigate and resolve production issues across frontend flows, backend services, databases, and on-site hardware/software configurations with minimal direction.

Software & Systems Engineer

June 2022 – May 2024

UBNL - Guidance, Navigation, and Control Team

Buffalo, NY

- Built and tested Guidance, Navigation, and Control software in C, Python, and NASA cFS for a student-led satellite program funded by the U.S. Army.
- Integrated gyroscope data and wrote magnetometer tooling used to support satellite orientation and navigation workflows in simulated flight conditions.
- Debugged sensor-integration issues across magnetometer and gyroscope workflows, then restructured portions of the software stack for stronger compatibility with Arduino-based hardware interfaces.
- Created a data extraction tool for 40,000+ function parameters, reducing manual lookup work and helping prevent Edison board overheating during development.
- Led weekly coordination with a 16-member cross-functional team, documented bugs, tracked blockers, and kept hardware and software work aligned.

PROJECTS

Project ROD M.U.G.E.N. | *M.U.G.E.N. Engine, Fighter Factory 3*

February 2018 – May 2024

- Built and maintained a long-running independent arcade fighting game with 200+ playable characters, 40 stages, custom UI work, and 5 game modes.
- Iterated on gameplay balance, menus, stages, and content updates over multiple years using feedback from regular players.

EDUCATION

SUNY at Buffalo

Bachelor of Science in Computer Science

Buffalo, NY

School of Engineering & Applied Sciences
